

LM317 3-TERMINAL ADJUSTABLE REGULATOR

SLVS044M – SEPTEMBER 1997 – REVISED FEBRUARY 2003

- Output Voltage Range Adjustable From 1.25 V to 37 V
- Output Current Greater Than 1.5 A
- Internal Short-Circuit Current Limiting
- Thermal Overload Protection
- Output Safe-Area Compensation

description/ordering information

The LM317 is an adjustable three-terminal positive-voltage regulator capable of supplying more than 1.5 A over an output-voltage range of 1.25 V to 37 V. It is exceptionally easy to use and requires only two external resistors to set the output voltage. Furthermore, both line and load regulation are better than standard fixed regulators.

ORDERING INFORMATION

T _J	PACKAGE†		ORDERABLE PART NUMBER	TOP-SIDE MARKING
0°C to 125°C	POWER-FLEX (KTE)	Reel of 2000	LM317KTER	LM317
	SOT (DCY)	Tube of 80	LM317DCY	L3
		Reel of 2500	LM317DCYR	
	TO-220 (KC)	Tube of 50	LM317KC	LM317
TO-220, short shoulder (KCS)	Tube of 20	LM317KCS		

† Package drawings, standard packing quantities, thermal data, symbolization, and PCB design guidelines are available at www.ti.com/sc/package.

Please be aware that an important notice concerning availability, standard warranty, and use in critical applications of Texas Instruments semiconductor products and disclaimers thereto appears at the end of this data sheet.

PRODUCTION DATA information is current as of publication date. Products conform to specifications per the terms of Texas Instruments standard warranty. Production processing does not necessarily include testing of all parameters.

LM317

3-TERMINAL ADJUSTABLE REGULATOR

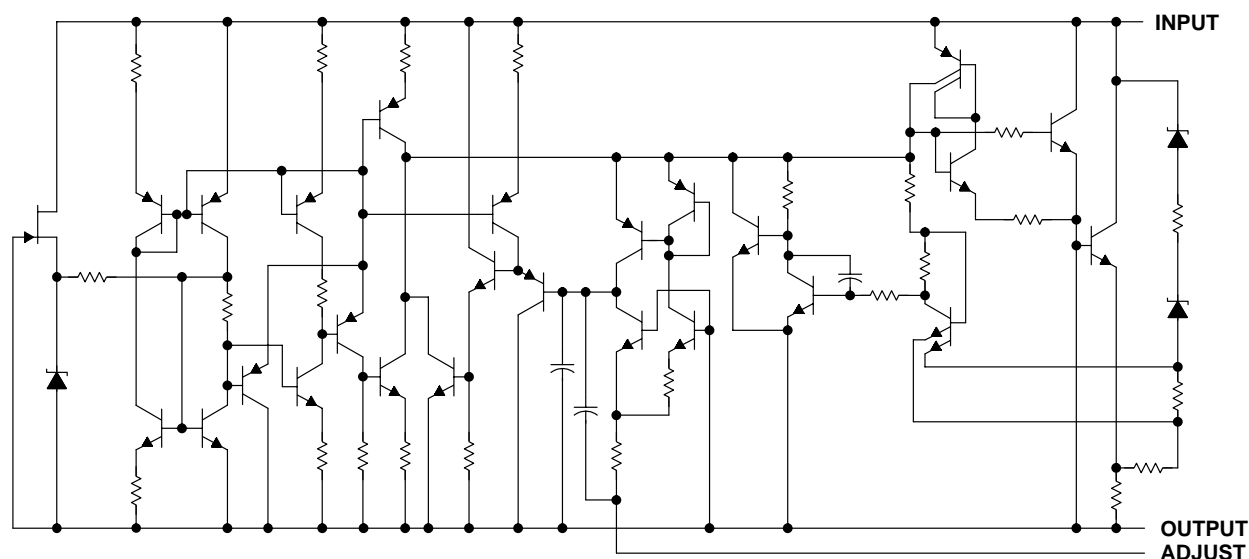

SLVS044M – SEPTEMBER 1997 – REVISED FEBRUARY 2003

description/ordering information (continued)

In addition to having higher performance than fixed regulators, this device includes on-chip current limiting, thermal overload protection, and safe-operating-area protection. All overload protection remains fully functional, even if the ADJUST terminal is disconnected.

The LM317 is versatile in its applications, including uses in programmable output regulation and local on-card regulation. Or, by connecting a fixed resistor between the ADJUST and OUTPUT terminals, the LM317 can function as a precision current regulator. An optional output capacitor can be added to improve transient response. The ADJUST terminal can be bypassed to achieve very high ripple-rejection ratios, which are difficult to achieve with standard three-terminal regulators.

schematic diagram

absolute maximum ratings over virtual junction temperature range (unless otherwise noted)†

Input-to-output differential voltage, $V_I - V_O$	40 V
Package thermal impedance, θ_{JA} (see Notes 1 and 2) DCY package	53°C/W
(see Notes 1 and 3) KC/KCS package	25°C/W
(see Notes 1 and 3) KTE package	23°C/W
Operating virtual junction temperature, T_J	150°C
Lead temperature 1,6 mm (1/16 inch) from case for 10 seconds	260°C
Storage temperature range, T_{stg}	-65°C to 150°C

† Stresses beyond those listed under “absolute maximum ratings” may cause permanent damage to the device. These are stress ratings only, and functional operation of the device at these or any other conditions beyond those indicated under “recommended operating conditions” is not implied. Exposure to absolute-maximum-rated conditions for extended periods may affect device reliability.

- NOTES: 1. Maximum power dissipation is a function of $T_J(\max)$, θ_{JA} , and T_A . The maximum allowable power dissipation at any allowable ambient temperature is $P_D = (T_J(\max) - T_A)/\theta_{JA}$. Operating at the absolute maximum T_J of 150°C can affect reliability.
2. The package thermal impedance is calculated in accordance with JESD 51-7.
3. The package thermal impedance is calculated in accordance with JESD 51-5.

recommended operating conditions

	MIN	MAX	UNIT
$V_I - V_O$ Input-to-output voltage differential	3	37	V
I_O Output current		1.5	A
T_J Operating virtual junction temperature	0	125	°C

electrical characteristics over recommended ranges of operating virtual junction temperature (unless otherwise noted)

PARAMETER	TEST CONDITION [†]	MIN	TYP	MAX	UNIT	
Line regulation [‡]	$V_I - V_O = 3\text{ V to }40\text{ V}$	$T_J = 25^\circ\text{C}$	0.01	0.04	%V	
		$T_J = 0^\circ\text{C to }125^\circ\text{C}$	0.02	0.07		
Load regulation	$I_O = 10\text{ mA to }1500\text{ mA}$	$C_{ADJ} = 10\ \mu\text{F}^{\S}$, $T_J = 25^\circ\text{C}$	$V_O \leq 5\text{ V}$		25	mV
			$V_O \geq 5\text{ V}$	0.1	0.5	% V_O
		$T_J = 0^\circ\text{C to }125^\circ\text{C}$	$V_O \leq 5\text{ V}$	20	70	mV
			$V_O \geq 5\text{ V}$	0.3	1.5	% V_O
Thermal regulation	20-ms pulse, $T_J = 25^\circ\text{C}$	0.03	0.07		% V_O /W	
ADJUST terminal current		50	100		μA	
Change in ADJUST terminal current	$V_I - V_O = 2.5\text{ V to }40\text{ V}$, $P_D \leq 20\text{ W}$, $I_O = 10\text{ mA to }1500\text{ mA}$		0.2	5	μA	
Reference voltage	$V_I - V_O = 3\text{ V to }40\text{ V}$, $P_D \leq 20\text{ W}$, $I_O = 10\text{ mA to }1500\text{ mA}$	1.2	1.25	1.3	V	
Output-voltage temperature stability	$T_J = 0^\circ\text{C to }125^\circ\text{C}$		0.7		% V_O	
Minimum load current to maintain regulation	$V_I - V_O = 40\text{ V}$		3.5	10	mA	
Maximum output current	$V_I - V_O \leq 15\text{ V}$, $P_D < P_{MAX}$ (see Note 1)	1.5	2.2		A	
	$V_I - V_O \leq 40\text{ V}$, $P_D < P_{MAX}$ (see Note 1), $T_J = 25^\circ\text{C}$	0.15	0.4			
RMS output noise voltage (% of V_O)	$f = 10\text{ Hz to }10\text{ kHz}$, $T_J = 25^\circ\text{C}$		0.003		% V_O	
Ripple rejection	$V_O = 10\text{ V}$, $f = 120\text{ Hz}$	$C_{ADJ} = 0\ \mu\text{F}^{\S}$		57	dB	
		$C_{ADJ} = 10\ \mu\text{F}^{\S}$	62	64		
Long-term stability	$T_J = 25^\circ\text{C}$		0.3	1	%/1k Hrs	

[†] Unless otherwise noted, the following test conditions apply: $|V_I - V_O| = 5\text{ V}$ and $I_{O\text{MAX}} = 1.5\text{ A}$, $T_J = 0^\circ\text{C to }125^\circ\text{C}$. Pulse testing techniques are used to maintain the junction temperature as close to the ambient temperature as possible.

[‡] Line regulation is expressed here as the percentage change in output voltage per 1-V change at the input.

[§] C_{ADJ} is connected between the ADJUST terminal and GND.

NOTE 1: Maximum power dissipation is a function of $T_J(\text{max})$, θ_{JA} , and T_A . The maximum allowable power dissipation at any allowable ambient temperature is $P_D = (T_J(\text{max}) - T_A)/\theta_{JA}$. Operating at the absolute maximum T_J of 150°C can affect reliability.

LM317

3-TERMINAL ADJUSTABLE REGULATOR

SLVS044M – SEPTEMBER 1997 – REVISED FEBRUARY 2003

APPLICATION INFORMATION

NOTES: A. C_i is not required, but is recommended, particularly if the regulator is not in close proximity to the power-supply filter capacitors. A 0.1- μF disc or 1- μF tantalum provides sufficient bypassing for most applications, especially when adjustment and output capacitors are used.

B. C_O improves transient response, but is not needed for stability.

C. V_O is calculated as shown:

$$V_O = V_{\text{ref}} \left(1 + \frac{R_2}{R_1} \right) + (I_{\text{Adj}} \times R_2)$$

Because I_{Adj} typically is 50 μA , it is negligible in most applications.

D. C_{ADJ} is used to improve ripple rejection; it prevents amplification of the ripple as the output voltage is adjusted higher. If C_{ADJ} is used, it is best to include protection diodes.

E. If the input is shorted to ground during a fault condition, protection diodes provide measures to prevent the possibility of external capacitors discharging through low-impedance paths in the IC. By providing low-impedance discharge paths for C_O and C_{ADJ} , respectively, D1 and D2 prevent the capacitors from discharging into the output of the regulator.

Figure 1. Adjustable Voltage Regulator

APPLICATION INFORMATION

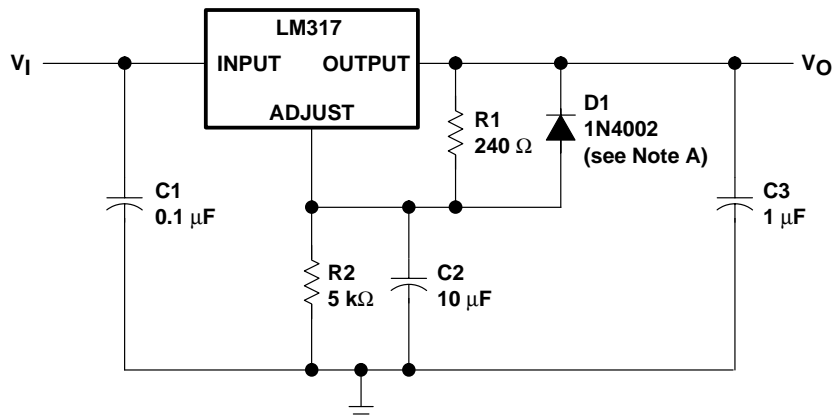

V_O is calculated as:

$$V_O = V_{ref} \left(1 + \frac{R2 + R3}{R1} \right) + I_{Adj}(R2 + R3) - 10 \text{ V}$$

Since I_{Adj} typically is $50 \mu\text{A}$, it is negligible in most applications.

APPLICATION INFORMATION

NOTE A: R_S controls the output impedance of the charger.

$$Z_{OUT} = R_S \left(1 + \frac{R_2}{R_1} \right)$$

The use of R_S allows for low charging rates with a fully charged battery.
