PLS100/PLS101

DESCRIPTION

The PLS100 (3-State) and PLS101 (Open Collector) are bipolar, fuse Programmable Logic Arrays (PLAs). Each device utilizes the standard AND/OR/Invert architecture to directly implement custom sum of product equations.

Each device consists of 16 dedicated inputs and 8 dedicated outputs. Each output is capable of being actively controlled by any or all of the 48 product terms. The True, Complement, or Don't Care condition of each of the 16 inputs and be ANDed together to comprise one P-term. All 48 P-terms can be selectively ORed to each output.

The PLS100 and PLS101 are fully TTL compatible, and chip enable control for expansion of input variables and output inhibit. They feature either Open Collector or 3-State outputs for ease of expansion of product terms and application in bus-organized systems.

Order codes are listed in the Ordering Information Table.

FEATURES

• Field-programmable (Ni-Cr link)

Input variables: 16

Output functions: 8

• Product terms: 48

• I/O propagation delay: 50ns (max.)

Power dissipation: 600mW (typ.)

Input loading: −100µA (max.)

Chip Enable input

Output option:

- PLS100: 3-State

- PLS101: Open-Collector

Output disable function:

- 3-State: Hi-Z

- Open-Collector: High

APPLICATIONS

- CRT display systems
- Code conversion
- Peripheral controllers
- Function generators
- Look-up and decision tables
- Microprogramming
- Address mapping
- Character generators
- Data security encoders
- Fault detectors
- Frequency synthesizers
- 16-bit to 8-bit bus interface
- Random logic replacement

PIN CONFIGURATIONS

be left open or connected to ground during normal operation.

N = Plastic DIP (600mil-wide)

A = Plastic Leaded Chip Carrier

The PLS100 device is also processed to military requirements for operation over the military temperature range. For specifications and ordering information consult the Philips Semiconductors Military Data Handbook.

Stresses above those listed may cause malfunction or permanent damage to the device.
 This is a stress rating only. Functional operation at these or any other conditions above those indicated in the operational and programming specification of the device is not implied.

NOTES:

- All typical values are at V_{CC} = 5V, T_{amb} = +25°C.
 All voltage values are with respect to network ground terminal.
- 3. Test one pin at a time.
- Measured with V_{IL} applied to CE and a logic high stored.
 Measured with a programmed logic condition for which the output test is at a low logic level. Output sink current is applied through a resistor to V_{CC}.

 6. Duration of short circuit should not exceed 1 second.
- 7. I_{CC} is measured with the Chip Enable input grounded, all other inputs at 4.5V and the outputs open.

NOTES:

- All typical values are at V_{CC} = 5V. T_{amb} = +25°C.
 All propagation delays are measured and specified under worst case conditions.
- 3. For 3-State output; output enable times are tested with $C_L = 30 pF$ to the 1.5V level, and S_1 is open for high-impedance to High tests and closed for high-impedance to Low tests. Output disable times are tested with $C_L = 5 pF$. High-to-High impedance tests are made to an output voltage of $V_T = (V_{OH} - 0.5V)$ with S_1 open, and Low-to-High impedance tests are made to the $V_T = (V_{OL} + 0.5V)$ level with S_1 closed.

LOGIC PROGRAMMING

PLS100/PLS101 is fully supported by industry standard (JEDEC compatible) PLD CAD tools, including Philips Semiconductors' SNAP, Data I/O Corporation's ABEL™ and Logical Devices Inc.'s CUPL™ design software packages.

All packages allow Boolean and state equation entry formats. SNAP, ABEL and CUPL also accept, as input, schematic capture format.

PLS100/PLS101 logic designs can also be generated using the program table entry format detailed on the following pages. This program table entry format is supported by the Philips Semiconductors' SNAP PLD design software package.

To implement the desired logic functions, the state of each logic variable from logic equations (I, B, O, P, etc.) is assigned a symbol. The sumbols for TRUE,

COMPLEMENT, INACTIVE, PRESET, etc., are defined below.

PROGRAMMING AND SOFTWARE SUPPORT

Refer to Section 9 (Development Software) and Section 10 (Third-party Programmer/ Software Support) of this dat handbook for additional informational.

OUTPUT POLARITY - (F)

"AND" ARRAY - (I)

"OR" ARRAY – (F)

NOTES:

- This is the initial unprogrammed state of all links. It is normally associated with all unused (inactive) AND gates P_n.
- 2. Any gate P_n will be unconditionally inhibited if any one of its (I) link pairs is left intact.

VIRGIN STATE

The PLS100/101 virgin devices are factory shipped in an unprogrammed state, with all fuses intact, such that:

- All P_n terms are disabled (inactive) in the AND array.
- 2. All P_n terms are active in the OR array.
- 3. All outputs are Active-High.
